A mineral mixture to remedy mineral deficiencies in
ornamental aquarium fish

DIPLORAL

manaus-aquarium

DIPLORAL should be used for 4 – 6 weeks directly after successful treatment against intestinal parasites. **DIPLORAL** provides the fish with important minerals and trace elements. If they are not given essential minerals, illnesses caused by mineral deficiencies can easily arise. Such as: the hole-in-the-head disease seen in cichlids and particularly discus fish, poor growth and deformities in the skeletons of juvenile fish (also missing gill covers in Discus fish in ornamental fish breeding).

Dosage:

5g per week per 100 litres (5g is approx. one heaped teaspoon), add to the aquarium water (with very soft water up to 10g per 100 litres).

Ingredients per g:

100 mg calcium

20 mg potassium

56 mg sodium

20 mg magnesium

216 mg chloride

82 mg sulfate

150 mg Hydrogencarbonate

Trace elements:

iron, zinc, manganese, cobalt

100g **DIPLORAL** is sufficient for 2000 litres of aquarium water. Also available in 500g. Expiration Date: see stamp.

Always follow the instructions before use. Keep out of reach of children and pets! Protect from light and heat.

Revision Date: September 2015
